

In The Specification

Please insert a paragraph at page 19, line 11, as follows.

FIG. 5 is a block diagram illustrating an apparatus 500 within a computing environment 505 for transfer of information in accordance with another embodiment of the invention. The computing environment may include one or more computer units. As illustrated in FIG. 5, the apparatus includes a first memory 510 and an alternate memory 520. The first memory is operable to store processing information. The alternate memory is operable to store selectively reallocated processing information that is initially stored or scheduled to be stored on the first memory. A history file 512, 522 containing historical processing information is established about a computing environment, or alternatively, about at least one application running in the computing environment. The history file is stored selectively on the first memory, as shown at 512, or the alternate memory, as shown at 522. Based on historical processing information contained in the history file, the computing environment is operable to determine an amount of the reallocated processing to be restored back to the first memory.
